Grove README

Medium-fi Prototype Link:

<https://www.figma.com/proto/hj37Hp9a3N7DWExdNbAEIv/Grove-Medium-Fi-Prototype?node-id=173%3A347&scaling=scale-down&page-id=0%3A3&starting-point-node-id=173%3A347>

Operating Instructions:

Our medium-fi prototype is available on Figma at the link above. Clicking on random white space will reveal bounding boxes which correspond to buttons that are links to various pages on the prototype.

The process of clicking around screens should be predominantly intuitive.

While we plan to have a variety of physical actions like toggling and typing in information available on the high-fi prototype, the main mechanism to go from one screen to another or to complete a task is clicking. For example, when filling in some text boxes, a simple click will reveal a sample input into that field as opposed to being able to choose what to write.

Navigation on the app is predominantly completed by choosing a page on the bottom navigation bar or clicking on buttons which finalize a sub-task (e.g. the 'Save' button after uploading photos as part of a reflection on an activity.)

Limitations:

- Not all buttons are clickable
- Limited functionality beyond core tasks
 - No adding friend features
 - No initial onboarding process and general settings updates

- Only allow interactions with fictional friends which are already added to the app
- Automated hangout feature is hard-coded
- Background image is low resolution
- No integration with camera roll or external social media

Wizard of Oz:

- Automated hangouts
 - Our medium-fi automatically generates one hangout with you and a fictional friend Blake
 - There is no customization or implementation of a stable matching algorithm here
 - This implementation is beyond the technical scope of a medium-fi prototype and will require the building out of a database first
- Photo album integration
 - This is because iOS and Android have different integrations, file types and upload systems, so we have left this out for now

Hard-coded items:

- All information about friends and activities on the app are currently hard-coded
- Photo uploads are also hard-coded
- Fill in of forms happens automatically (i.e. no custom input of information)
- Automatic generation of activity is hard-coded

We chose to hard code these components because this still allows for click through of all core tasks of the app, without needing to integrate a database or typable form features at this stage in the design process.
